Abstract - Mobile Computing gains in last years an increasing importance. It penetrates into new areas of everyday life. Mobile computing is a new style of computer access emerging because of two currently dominant trends: producing portable computers in computer industry and wireless communication in telecommunication industry. This paper deals with some key issues involved in realizing a mobile wireless computing environment by examining the characteristics of each component: mobile computer, wireless communication network and coordination software.

Keywords: Mobile Computing, portable computers, wireless communication network, coordination software.
